## **Declaration of the Director of the Holy See Press Office, Matteo Bruni**

The post-operative progress of His Holiness Pope Francis continues to be regular and satisfactory.

The Holy Father has continued to eat regularly and infusion therapy has been suspended.

The final histological examination has confirmed a severe diverticular stenosis with signs of sclerosing diverticulitis.

Pope Francis is touched by the many messages and the affection received in these days, and expresses his gratitude for the closeness and prayer.
